

语义驱动与物理反馈闭环的卫星总体构型演化系统

下一代生成式工程设计引擎 | 2026-2027 实施蓝图

语义

物理

摘要：从“工具辅助”跨越至“智能伴随”

5倍效率提升的工程范式

核心挑战 (The Challenge)

- 多学科强耦合 (Multi-disciplinary Coupling)
- 设计周期压缩 (Compressed Cycles)
- 专家经验流失 (Experience Loss)

痛点：传统“人工迭代+离线仿真”模式难以收敛，无法应对星座批量需求。

解决方案 (The Solution)

神经符号协同 (Neuro-Symbolic Collaboration)

LLM (大模型)：
处理离散拓扑逻
辑与模糊意图。

Solver (数值求解)
：处理连续参数
与物理约束。

机制：双层闭环演化。

建设目标 (The Goal)

2026年底交付原型

特性：人机协同、自动寻优、全程追溯。

关键指标：典型舱段布局设计效率提升 >500%。

产出：数字化热控与结构设计规则库。

研制通量指数级增长 要求设计模式的根本 变革

行业正从“单星定制”转向“星座批量交付”。人类设计师的认知带宽限制了对全局设计空间的探索，导致设计往往局限于历史经验的局部最优。

Human Capability vs Project Demand

核心理念：神经符号协同解决“非凸离散拓扑”难题

Structuring non-structured engineering intent into mathematical constraints.

为什么混合?

- LLM 单独使用 -> 幻觉 (Hallucinations) / 无物理精度
- Solver 单独使用 -> 陷入局部最优 (Local Optima) / 无法改变拓扑

双视角架构：物理现状与演化能力的解耦

纵向物理视角
(Vertical Physical View)
– Reality

直接对接仿真 (Simulation Interface) | 描述“是什么” (What is)

横向算子视角
(Horizontal Operator View)
– Evolution

定义可执行代码 (Executable Actions) | 描述“怎么变” (How to change)

双层闭环机制：微观数值寻优与宏观语义决策

系统架构总览：五大核心模块协同

架构特征：基于 Python Flask 微服务 | JSON Schema 松耦合通信

模块详解 I：主控编排与语义映射 (The Brain)

0. Orchestrator

1. Semantic

主程序状态不受 LLM 管理 (Safety)

安全性：“可执行性”由代码保证，而非模型。

模块详解 II：几何算子与多层级搜索 (The Action)

2. OpsGeo (Geometry)

Differential Update

4. SearchOpt (Optimization)

Macro: 拓扑跳转 (Topology Jump)

Micro: 连续寻优 (Continuous Opt)

Budget Control

Cost (费用)

Time (时间)

Convergence (收敛)

模块详解 III: 多保真仿真与闭环评估 (The Validator)

Run Orchestration

Multi-Fidelity (MF) Interface

IO Backfill

关键接口: LLM 仅接收'可读摘要' (Readable Summary) , 不接触底层网格。

数据协议层：确保可解释性与 防幻觉机制

Input to LLM (ContextPack)

```
{  
  "summary": "Battery temp > 50C",  
  "conflicts": ["Space_Violation_ID_01"],  
  "hints": ["Try moving +Y axis"]  
}
```

Markdown (Readable) +
JSON (Structural)

Output from LLM (SearchSpec)

```
{  
  "op_id": "MOVE_BATTERY",  
  "target": "BAT_01",  
  "bounds": [-50, 50],  
  "unit": "mm"  
}
```

Strict Schema. Op names
must exist in OpLib.

Why Important?

- Semantic Gatekeeper (语义守门员)
- Auditable (可审计)
- Replayable (可重放)

实施路线图：三代演进策略

阶段详情：从架构验证到全流程闭环

DV1.0 (V1.0 - V1.2) - The Skeleton		DV2.0 (V2.0 - V2.3) - The Flesh	
V1.0	Simplified Architecture. Metric: Module Test 100%.	V2.1	History & Replay. "可回退、可重放、可审计 (Replayable & Auditable)."
V1.2	End-to-end minimal loop. LLM access enabled. Metric: Success rate $\geq 80\%$.	V2.2	Frozen State Protocols. Optimization of prompts. Constraint Satisfaction $\geq 80\%$.
		V2.3	Visualization UI. One-Click Demo.

Foundational Stability (Inter, JetBrains Mono)

阶段详情：迈向工程实战的鲁棒性构建

DV3.0 (V3.0 - V3.4) - The Brain

V3.1	Auto-Routing (自动布线) Resolving complex cable constraints. Feasibility $\geq 85\%$.
V3.2	Acceleration (提速) Proxy models (Surrogate) to speed up evaluation 5x.
V3.3	Robustness (鲁棒性) Material drift/aging modeling (Emissivity changes).
V3.4	Self-Healing (自愈) Auto-recovery from failure. Success Rate $\geq 90\%$.

结语：构建设计、验证与进化的数字底座

从经验主义迈向数字主权。
(Transforming from Empiricism to Digital Sovereignty.)

Establishing a core competitive advantage in the constellation era.
